

Music for the Dark:
The Confusion of Stars

People orbit one another in a model world,
carrying lights that blink in silence at different
rates. Each one revolves internally while
circling a slower blinker. Moons circle planets,
planets circle stars. Stars might wander.

Circling without tools, words, or outside light,
but making a way slowly through the dark,
which is broken, periodically, by moving points.

With metronomes or other objects that emit
regular pulses of light.
